

Routing

Auto Router

Configure which models the Auto Router can route to.

Route to the best model for each request using [openrouter/auto](#) and [openrouter/auto-beta](#). [Learn more](#)

Cost Tier

Max

Only models within the selected cost band are used for routing. Lower tiers favor cheaper models, while higher tiers favor more capable, expensive ones.

Restrict to Allowed Model List

anthropic/*, openai/gpt-4o, google/*

Use model patterns to control which models the auto-router can route between. Separate patterns with commas or newlines, and use wildcards such as "anthropic/*" to match a model family. Leave empty to let the auto-router choose from every model it ranks for your request.

Prevent overrides ⓘ

Save

Default Provider Sort

Choose how providers should be sorted for your requests.

Choose how providers should be sorted. Individual requests can override this setting.

By default, OpenRouter balances low prices with high uptime. [Learn more](#).

Latency (lowest first)

 Saved

Set the default model for apps and fallback routing.

Apps will use this model by default, but they may override it if they choose to do so.

This model will also be used as your default fallback model.
